Partitioning

Outline

Partitioning ? What is it ?

Advantages of partitioning

Partitioning techniques

Range partitioning

List partitioning

Composite partitioning

Partitioning ? What is it ?

Partitioning is a strategy for solving hard computationally complex problems

Partitioning is based on an idea of breaking large, and difficult problems into smaller ones and solving them one by one

Range partitioning divides data into smaller chunks such that some of them can be ignored during data processing

Partitioning of relational tables is transparent to user applications;

Partitioned relational table or **index** is processed by the applications as one table or one index

Physically a **partitioned relational table** or **index** consists of many smaller components

Partitioning uses a concept of **partition key** to determine which partition a row belongs to

Partition key may be based on **range of values**, a **list of specific values**, or a **value of hash function**

Partitioning

Outline

Partitioning ? What is it ?

Advantages of partitioning

Partitioning techniques

Range partitioning

List partitioning

Composite partitioning

Advantages of partitioning

Performance related observations

Partitioning increases availability of data

Partitioning eases administration of large relational tables

Partitioning improves performance of some queries

Partitioning may reduce contention on high volume online processing system by spreading out modifications over many separate partitions

Some partitions do not need to be considered for query processing

Parallel DML is possible on partitioned relational tables

Partitions can be used to increase concurrency by elimination of access conflicts, e.g. many partitioned indexes

Partitioning speeds up processing in data warehouse/decision-support systems

Advantages of partitioning

Independence of each partition increases availability

Partitioned relational table

```
CREATE TABLE EMP(  
  enum    NUMBER(6)    NOT NULL,  
  name    VARCHAR(30)  NOT NULL,  
  CONSTRAINT EMP_PKEY PRIMARY KEY(enum))  
PARTITION BY HASH(enum)  
(PARTITION EMP1 TABLESPACE TBS1,  
 PARTITION EMP2 TABLESPACE TBS2);
```

INSERT into partitined relational table

```
INSERT INTO EMP VALUES( 1, 'James');
```

SELECT on a partition

```
SELECT *  
FROM EMP PARTITION(EMP1);
```

Advantages of partitioning

Partitioning

Outline

Partitioning ? What is it ?

Advantages of partitioning

Partitioning techniques

Range partitioning

List partitioning

Composite partitioning

Partitioning techniques

Range partitioning

- **Range partitioning** uses ranges of data to determine the location of data; e.g. all transactions finalized in January

Hash partitioning

- **Hash partitioning** uses hash function to determine the location of data; e.g. an attribute has a hash function applied to it

List partitioning

- **List partitioning** uses discrete sets of values to determine the location of data; e.g. all rows with a value of attribute **STAT** equal to 'F', 'P' should be located in the same partition

Composite partitioning

- **Composite partitioning** is a combination of range, hash, and list partitioning; e.g. it allows to apply range partitioning to some data and later on within that range location of data is determined by **hash** or **list partitioning**

Partitioning

Outline

Partitioning ? What is it ?

Advantages of partitioning

Partitioning techniques

Range partitioning

List partitioning

Composite partitioning

Range partitioning

A sample **range partitioned** relational table **EMP**

Creating a range partitioned relational table

```
CREATE TABLE EMP(  
  enum      NUMBER(6)      NOT NULL,  
  name      VARCHAR(30)    NOT NULL,  
  hired     DATE           NOT NULL,  
            CONSTRAINT EMP_PKEY PRIMARY KEY(enum))  
PARTITION BY RANGE(hired)  
  (PARTITION P1 VALUES LESS THAN  
    (TO_DATE('01-JAN-2005', 'DD-MON-YYYY'))  
  PARTITION P2 VALUES LESS THAN  
    (TO_DATE('01-JAN-2009', 'DD-MON-YYYY'))  
  );
```

SELECT statement accessing a range partitioned relational table

```
SELECT *  
FROM EMP PARTITION(P2);
```

Partitioning

Outline

Partitioning ? What is it ?

Advantages of partitioning

Partitioning techniques

Range partitioning

List partitioning

Composite partitioning

List partitioning

A sample **list partitioned** relational table **EMP**

Creating a list partitioned relational table

```
CREATE TABLE EMP(  
  enum      NUMBER(6)  NOT NULL,  
  name      VARCHAR(30) NOT NULL,  
  status    CHAR(1)    NOT NULL,  
  CONSTRAINT EMP_PKEY PRIMARY KEY(enum))  
PARTITION BY LIST(status)  
  (PARTITION P1 VALUES ('S','M'),  
   PARTITION P2 VALUES ('U'));
```

SELECT statement accessing a list partitioned relational table

```
SELECT *  
FROM EMP  
WHERE STATUS = 'U';
```

Partitioning

Outline

Partitioning ? What is it ?

Advantages of partitioning

Partitioning techniques

Range partitioning

List partitioning

Composite partitioning

Composite partitioning

A sample **composite partitioned** relational table **EMP**

Creating a composite partitioned relational table

```
CREATE TABLE EMP(  
  enum      NUMBER(6)      NOT NULL,  
  name      VARCHAR(30)    NOT NULL,  
  hired     DATE            NOT NULL,  
            CONSTRAINT EMP_PKEY PRIMARY KEY(enum))  
PARTITION BY RANGE(hired)  
SUBPARTITION BY HASH(enum) SUBPARTITIONS 2  
  (PARTITION P1 VALUES LESS THAN  
    (TO_DATE('01-JAN-2005', 'DD-MON-YYYY'))  
    (subpartition P1_1, subpartition P1_2)  
  PARTITION P2 VALUES LESS THAN  
    (TO_DATE('01-JAN-2009', 'DD-MON-YYYY'))  
    (subpartition P2_1, subpartition P2_2)  
);
```

Composite partitioning

A sample **composite partitioned** relational table **EMP**

Creating a composite partitioned relational table

```
CREATE TABLE EMP(  
  enum      NUMBER(6)      NOT NULL,  
  name      VARCHAR(30)    NOT NULL,  
  hired     DATE           NOT NULL,  
            CONSTRAINT EMP_PKEY PRIMARY KEY(enum))  
PARTITION BY RANGE(hired)  
SUBPARTITION BY VALUES(name) SUBPARTITIONS 2  
  (PARTITION P1 VALUES LESS THAN  
    (TO_DATE('01-JAN-2005', 'DD-MON-YYYY'))  
    (subpartition P1_1 values('James','Jane')  
    subpartition P1_2 values('Kate','Ben'))  
  ...  
);
```
